

– Hinglish Explanation

React Developer Tools ek debugging tool hai jo React se bani websites aur applications ko inspect aur troubleshoot karne mein help karta hai.

Iske through aap:

- React **components** ko inspect kar sakte ho
 - Components ke **props** aur **state** dekh aur edit kar sakte ho
 - Application mein hone wali **performance problems** identify kar sakte ho
-

Browser extension

React website ko debug karne ka sabse easy method hai apne browser mein **React Developer Tools extension** install karna.

Extension install karne ke baad jab aap React se bani website open karoge, browser DevTools mein do naye panels milenge:

1. Components panel

Is panel mein application ka complete React component tree dikhai deta hai.

Aap kisi component ko select karke uske:

- Props
- State
- Component structure

ko inspect kar sakte ho.

2. Profiler panel

Profiler React application ki performance problems identify karne ke liye hota hai. Isse pata lagane mein help milti hai ki application ke components render hote samay performance issue kahan aa raha hai.

Safari aur doosre browsers

Agar aap Safari ya kisi aise browser ka use kar rahe ho jiske liye extension available nahi hai, toh react-devtools npm package install kar sakte ho.

Yarn se install karna

```
1 yarn global add react-devtools
```

npm se install karna

```
1 npm install -g react-devtools
```

Installation ke baad terminal mein ye command run karo:

```
1 react-devtools
```

Isse standalone React Developer Tools open ho jayega.

Website ko standalone DevTools se connect karna

Apni website ko standalone React DevTools se connect karne ke liye website ke <head> section ki beginning mein ye script add karni hogi:

Yahan `http://localhost:8097` par standalone React DevTools run ho raha hota hai.

Script add karne ke baad website ko browser mein **reload** karo. Ab website React Developer Tools se connect ho jayegi aur aap uske components inspect kar paoge.

Ye standalone setup mainly Safari aur un browsers ke liye diya gaya hai jahan normal extension available nahi hai.

Mobile applications: React Native

React Native se bani mobile applications inspect karne ke liye **React Native DevTools** use hota hai.

Ye React Native ka built-in debugger hai aur React Developer Tools ke saath deeply integrated hai. Browser extension wale features isme bhi similarly kaam karte hain, including:

- React components inspect karna
- Native elements ko highlight karna
- Native elements select karna

Purane React Native versions

Agar React Native version **0.76 se pehle** ka hai, toh built-in React Native DevTools ke bajaye standalone React DevTools setup use karna chahiye. Iske liye wahi npm/Yarn installation aur connection process follow hoga jo Safari section mein diya gaya hai.

Short summary

- **Chrome, Firefox ya Edge:** Browser extension install karo.
- **Safari ya other unsupported browsers:** react-devtools npm package install karke standalone tool use karo.
- **React Native 0.76 ya newer:** Built-in React Native DevTools use karo.
- **React Native 0.76 se older:** Standalone React DevTools use karo.
- **Components panel:** Components, props aur state inspect/edit karne ke liye.
- **Profiler panel:** Performance problems identify karne ke liye.
